LIGHT

EMITTING

DIODES

Want to find out more about the development and manufacturing of LED light modules? Then talk to the experts.

LED's (Light Emitting Diodes), available in a variety of shapes and adjustable colours, directly convert very low energy levels into light. For the amount of light output they yield, LED's require minimal current.

Our modules shine their light over a range of different applications. Lines of light for floors and buildings (alternative for neon), signpost lighting for indoors and outdoors: marking staircases, passageways by night, driveways, paths, courtyards, bathroom lighting and swimming pool surrounds bring a magical and futuristic ambience. Signpost and safety lighting intended for maritime applications furthers the physical protection of persons and gives an improved sense of orientation. The decorative illumination of pictograms and house numbers adds that extra touch of atmosphere which comes with clear information.
